

How plants make food

Name _____

Date _____

How plants make food

Word equation for photosynthesis

Chlorophyll captures the light

Chlorophyll absorbs light energy in plant cells, and photosynthesis stores that energy as chemical energy in glucose.

Water and carbon dioxide supply the atoms for that glucose, and oxygen leaves the plant as a gas. The light is not kept as light. It is transferred into the sugar the plant builds, so the plant holds that energy in a chemical form it can use later.
